Harry works at a software company as a software engineer and wants to manage both his work appointments and his personal life with the same application to make checking his calendar and seeing everything he has going on as easy as possible. He has constant access to the internet as he has a smartphone. He accesses the app through the home page of his smartphone and comes on a screen showing the current date. To set an appointment for work he clicks on the appointment widget, he then wants to show that the appointment is for work, so he clicks on change colour and sets the colour of the appointment from the default blue to green, he also wants to set it to be urgent, so the appointment will now be shown as half green half red. He wants to set it to be at 11:00am, so he moves the clock hands on his phone to show 11:00am, and then sets the name of the appointment to be "Meeting with Boss", he puts the "related party" section to be "boss", which tells the calendar that the party that is related to the event is his boss, and will connect the contact details of that party to this event. He also wants to set a reminder that he has to help his friend move out that same day at 4:00pm, as this is a personal task, he leaves the colour of the reminder as the default blue, and since his friend has lots of people helping, it is not 100% necessary that he be there, so he doesn't set it to be urgent either, he sets it to be called "Help friend move", he sets the "related party" to be his friend as well. When he gets into work the next day at 9:00am and checks his calendar in the calendar application on his desktop, he sees that for today there is an urgent event, as there is a red bar across the top of the application, when looking through the day, he sees that there are two events, one is half green half red at 11:00am, and one is fully blue at 4:00pm. He receives a notification that a meeting has been scheduled by his department lead scheduled for 4:00pm and is marked as urgent, as this conflicts with his personal event, the calendar sends a notification to him, prompting him to fix this conflict. The prompt sends him back into the application and shows the events side by side, in boxes which are outlined by their respective colours, so he knows which is set to be urgent, personal and/or work related, giving him the option to either change the time of one of the events or delete one of the events. He decides to delete the personal event, upon which he is given a prompt asking him if he wishes to contact the "related party" that is connected to the event via video call or email. After contacting his friend, he is going to help him the next day with whatever is left to be done, to see when he has time, he looks to his calendar for what he has planned for the next day, and sees that the weekly stand up meeting that is repeated every week, is planned for 2:00pm, which is denoted by the colour yellow for repeated on the bar, because of this, he plans to give him a buffer after the meeting as he knows that it can sometimes go over time, and says that he will help his friend at 4:30pm the next day, and puts this into his calendar as he did before.
